

Seal

Empire: animals

Class: mammals

Mass: 55-130kg

Body size: 1,4-2m

Body color: gray-brown, sandy

Appearance: water/land-north hemisphere

Food: fish (salmon)

About..

I choosed seals because they are really cute and charming animals. Seals are one of the largest mammals. They are about 500 thousand individuals in the world. Seals belong to one of endangered species. They live in the water but also on the land. The most often on the northern Atlantic and Pacific coast. Their body is 1,4-2m long and their mass is about 55-130kg. Their fur is grey-brown even sandy color. Male is darker. He has got dark spots on his back which makes them different. Small cubs have got fur which is protection against the cold. Their food consists of fish like salmon. They also can take out fish from fishing net and of course fishers are not so glad for that. They live in groups (smaller or larger). They are really good swimmers. They usually stay under the water about 5-10min. but they can stay under the water even 45min. Females lie in cub after 11 months. They have only one cub which is hidden behind the rocks to keep in safe.
